

## **GUTTER GUARD SYSTEM**

**The System that prevents more than just Clogged Gutters**

### **The Science behind the System**

- A patented, scientifically engineered gutter protection product
- Maintains efficient water flow and drainage off the roof and away from the home
- Designed to eliminate clogged gutters and downspouts, and the resulting water damage problems to the roofline area, fascias, timbers and roof timbers.
- Saves the time and money spent cleaning gutters year after year unlike mesh or brush gutter defenders which collect debris and have to be removed, pressure washed and re-fitted
- Leaf and twig debris is deflected over the steps and falls to the ground below.
- Water adheres to the product as it flows over the downward steps, into the channels, through the drain holes and into the gutter.
- Prevents birds and other rodents from using and dwelling in the gutter system, and gaining access.
- An exclusive fin-leg acts as a sealing device that helps water and ice from backing up under the roof tiles.
- Made of rigid polyvinyl chloride (PVC) for durability
- Cuts easily, while flexible joint adjusts for installation on roofs of any slope.
- Fits ALL types of Plastic and Aluminium Gutter in various shapes and sizes - Black/White/even Brown

# THE ALTERNATIVES

## The other Methods that Don't Work

### Gutter Brush System

These are not able to be fixed in place, merely rest in the trough of the gutter and until they become weighted with debris, they can blow out of the gutter with a gust of wind. Once they have been in use, they collect unsightly debris which can usually be seen from the ground. They do not prevent the down pipe becoming blocked. As they collect the debris, they have, to be removed, cleaned and re-fitted, this can be a costly annual task.

### Mesh System

This system, usually plastic, some are aluminium, sits across the trough of the gutter, and they are really, only designed for the simplest round gutter, they are limited. They are awkward to fit, but the main problem is they collect leaves and debris on the mesh and it builds up to form a 'carpet layer of rotting leaves. This allows the rain water to flow over the matted debris and straight onto the ground below; you might just as well take your gutters off and throw them away. To remain effective, usually after Autumn, you have to remove them, often awkward to do, bring them down usually pressure washing is the only way to clean them, take them back up and re-fit again at yet a cost again.

### Simple Downpipe Balloon

These pipe balloons are fine if you have a low, short gutter length to maintain, a garage for example. They are usually plastic, can also be wire; they fit into the outlet of the gutter feeding the downpipe. They help to prevent leaves and debris going down the Pipe and causing below ground blockages. On a main roof, a different matter; leaves and debris backs up and blocks the outflow of rain water. – you don't see this build up until it's too late. Then, you, have to go up clean the gutters out - costly, usually annually. Was the Balloon worth the few pounds?
